

# Cross Promotion

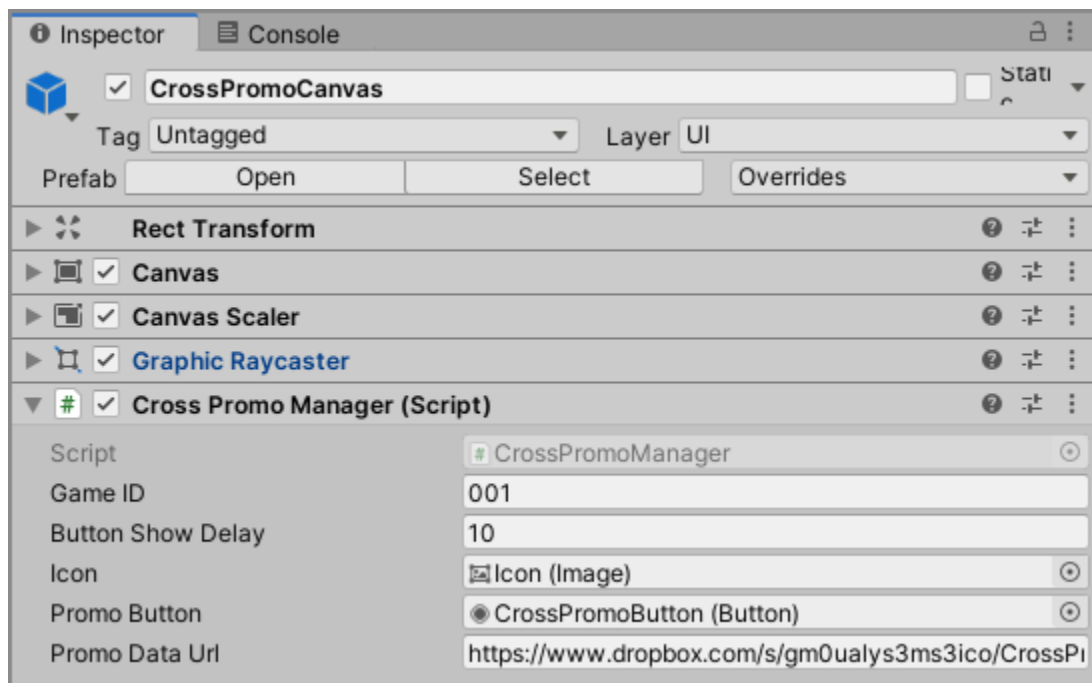

## Installation:

- Import plugin to project
- Drag the canvas prefab to splash screen [1<sup>st</sup> game screen]

*Assets/CrossPromo/Prefab/CrossPromoCanvas.prefab*

- Set up the URL to **Promo Data URL** field. This url points to the JSON file.

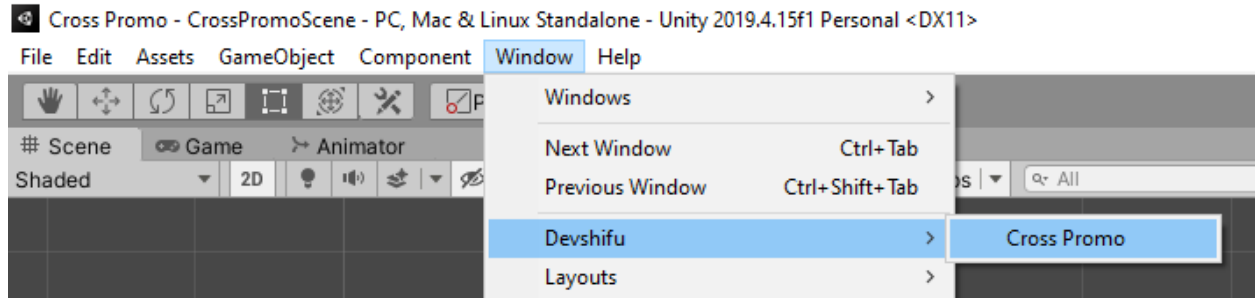

*URL example: <https://www.dropbox.com/s/gm0ualys3ms3ico/CrossPromoData.json?raw=1>*

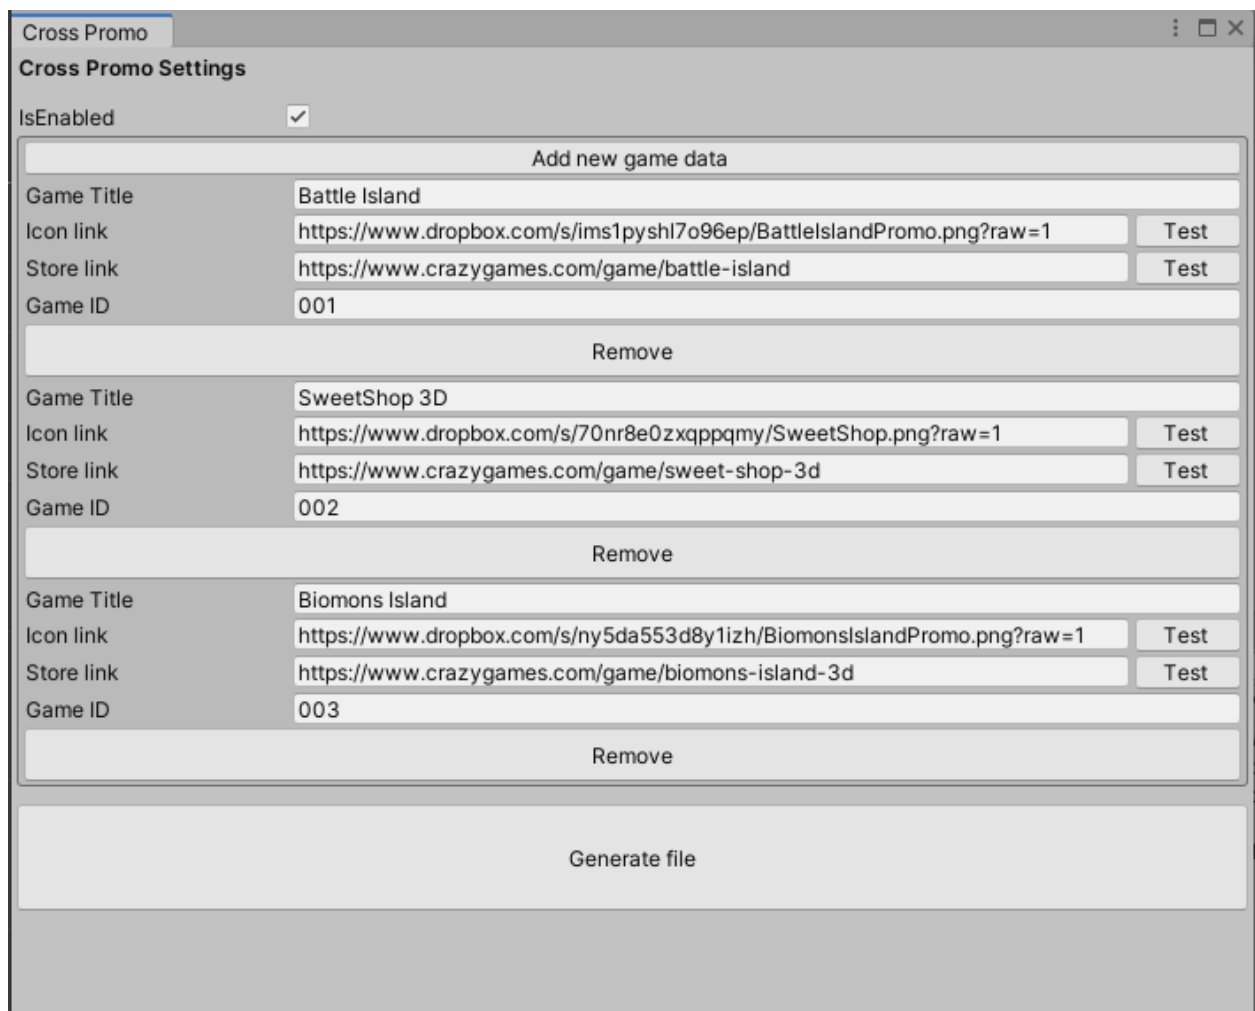

- Set the GameID. The GameID is used to discard data of same game from json so we dont show AD of this particular game.
  - Set the "Button Show Delay" time. The value is in second. The promo button will be shown after the delay time is complete. The time calculation started at launch of game.
- Run the game, as soon as time is up the Promo Icon will be shown.

## Setting up JSON data:

- Go to Windows/Devshifu/Cross Promo

- Window will popup where you can add or remove the data.

- I have uploaded the files to **DropBox** so the URL should end with **raw=1** after the **?**, else the data will not be downloaded

- After adding the required details click on Generate File button to create a new files.  
The new file will be created at path  
***Assets/CrossPromo/PromoFiles/CrossPromoData.json***
- Upload this file and now you are ready.
